ABSTRACT

This study explores hotel employees' perceived corporate social responsibility (CSR) within the proposed conceptual model under the umbrella of self-determination and needs satisfaction theory. The model examines dichotomous perceived CSR relationships – instrumental and volunteer CSR – with employees' basic needs satisfaction, self-esteem, hedonic and eudemonic happiness, and innovativeness. Structural equation modeling (SEM) was applied to examine the assumed hypotheses. The results established that hotel employees perceived instrumental CSR has a significant positive influence on the satisfaction of their basic needs, and perceived volunteer CSR impact employees' self-esteem. Employees' basic needs satisfaction demonstrated a significant positive influence on their hedonic happiness and self-esteem on eudemonic happiness. Both hedonic and eudemonic happiness contribute significantly to employee innovativeness, where, eudemonic happiness contribution is higher than hedonic happiness. The findings expand the literature on CSR by providing a better understanding of the core mechanism through which CSR can influence hotel employees' happiness, where, a happy employee is a key to innovativeness, competitiveness, and better organizational performance.

KEYWORDS

CSR; basic needs satisfaction; self-esteem; hedonic happiness; eudemonic happiness; employee's innovativeness

1. Introduction

Corporate social responsibility has become a hot debate in the business world over the last few decades. The hospitality industry actively participates in green initiatives, community development, charities, and environmental protection accomplishments. Trends reveal that literature on CSR in tourism and hospitality academics largely concentrates on the organizational level (macro-level) and fewer considerations have been paid to employees level (micro-level) CSR (B. Hu et al., 2019). CSR has become a novel strategy for retaining and attracting a skilled, qualified, and talented workforce (Bibi et al., 2020). Employees are the most precious asset of any organization, especially in the hospitality industry. The CSR initiative satisfies the economic, social, and communal needs of various stakeholders.

CSR is a firm social obligation – consisting of economic, legal, ethical, and philanthropic dimensions – towards the society (Hongdao et al., 2019). The majority of research analyzed CSR as a macro-level phenomenon, and less attention is paid to a micro-level outlook (H. Kim et al., 2020). The hotel industry research has explored employee response to organizational or employee level CSR concerning organizational citizenship behaviour, work engagement, identification, commitment, performance, and customer satisfaction (Hongdao et al., 2019; H. Kim et al., 2020). Employees in the hotel industry are the ones who have a direct relationship with the customer. A happy employee means a happy customer (Khan, Bibi, Lyu, Garavelli, et al., 2020). Happiness at organization matters (der Kinderen & Khapova, 2020); hotels strive to retain and attract well-performing and innovative employees.

There is no universal agreement among the scholars in defining happiness and its constructs (Kim-Prieto et al., 2005). Happiness is often connected with subjective well-being, quality of life, emotional well-being, and positive affect (Edward Diener et al., 2002). It reveals that the meaning of happiness is contextual (Carlquist et al., 2017). Subjective happiness is a global evaluation of life satisfaction, and subjective well-being is a life quality evaluation (Edward Diener et al., 2002). Well-being is considered a much broader concept than happiness (Khan, Bibi, Lyu, Alam, et al., 2020; Khan, Bibi, Lyu, Raza, et al., 2020). Researchers measured happiness as unidimensional and multidimensional constructs based on the research's context and objective (Medvedev & Landhuis, 2018). Overall well-being constructs of life satisfaction and positive and negative emotions are linked to hedonic happiness or subjective well-being (Fisher, 2014). The eudemonic happiness constructs comprise flow, vigour, meaningfulness, intrinsic motivation, dedication, and thriving (Grant & McGhee, 2020). Scholars explored CSR linkages with community happiness, societal happiness, subjective well-being at the workplace. However, CSR, happiness, and innovativeness is less explored at workplace.

Happier employees are more receptive to new ideas, learning new skills, and performing more than expected. When employees enjoy working conditions, they tend to be more innovative (Bani-Melhem et al., 2018). Innovativeness requires push factors such as validation by others, self-confidence, mastery, and purpose (Khan, Bibi, Lyu, Garavelli, et al., 2020). Self-confidence and creativity motivate employees to experiment and take a calculated risk to convert their creative ideas to unique products and services (Leal et al., 2015).

This paper aims to explore the literature gap between CSR and employee happiness. This study investigated why employee cares for hotel CSR practices and its effects on their happiness. As an element of positive psychology, happiness has two components, hedonic and eudemonic happiness. Hedonic happiness is the summation of high-level positive and low-level negative effects and life satisfaction, mostly dealing with pleasure, enjoyment, and minimization of pain (Sirgy, 2012). In contrast, eudemonic happiness is to live virtuously – acting with the virtue of soberness, wisdom, love, and utilizing full potentials (Seligman, 2002).

Under the umbrella of self-determination (Patrick et al., 2007) and need satisfaction theory (Deci & Vansteenkiste, 2004), this study attempt to develop logical linkages between CSR, hedonic and eudemonic happiness through the individual-level mechanism in the context of the hotel industry. Employees have needs, and they bring them to their respective organizations and attempt to fulfil them through work. Need satisfaction theory hold that individual basic needs must be satisfied to feel pleasure or enjoy his/ her work (Arshadi, 2010). On the other hand, self-determination theory holds that individuals have tendencies to grow and are motivated to achieve the highest level of needs, such as self-actualization, autonomy, competence, relatedness, and aesthetic needs (Patrick et al., 2007).

CSR does not directly influence employee hedonic and eudemonic happiness in the hotel business context. However, through indirect means, CSR influences employee happiness and results in better performance and innovativeness. This study divided CSR into two categories: instrumental and volunteer CSR. Instrumental CSR is directly related to employees' basic needs, including economic and security needs. Volunteer CSR is comprised of helping others, work for community,

and personal growth. We assume that instrumental CSR's perception influences employees' satisfaction with basic needs, leading to hedonic happiness. Volunteer CSR influences employee self-esteem, self-identity, and pride, leading to eudemonic happiness. This study extends CSR and happiness literature by identifying that employees perceived CSR could be used to satisfy employees' basic and growth needs as identified by Sirgy and Wu (2009). Second, explored the impacts of basic need satisfaction on hedonic happiness and self-esteem on eudemonic happiness. Third, employee hedonic and eudemonic happiness are positively associated with employees' innovativeness. Our research model is the first to develop and test a model that links perceived CSR to need satisfaction, happiness, and innovativeness.

2. Theoretical background and hypotheses development

2.1. CSR and hospitality industry

CSR is an organization's discretionary business initiatives to enhance community well-being beyond obligations and compulsions (H. Kim et al., 2020). There is an academic difference in the conceptualization of CSR. However, it can be labelled as the constant obligation and assurance to meet the ethical and legal standards of production and economic development (Hongdao et al., 2019; Su & Swanson, 2019). The tourism and hospitality sector is blamed for environmental degradation, economic and social evils (Khan, Bibi, Ardito, et al., 2020; Khan, Bibi, Lorenzo, et al., 2020; Khan, Bibi, Lyu, Latif, et al., 2020). Over the last few decades, tourism and hospitality research has concentrated on CSR to enhance customer satisfaction, employee productivity, loyalty, and social support. However, tourism and hospitality research in CSR is lagging and underdeveloped with a scrappy frame of knowledge. Economic development, technological advancement, globalization, and demographic changes have influenced customer preferences, employee prospects, and societal expectations (B. Hu et al., 2019).

The hospitality industry has integrated CSR into business operations to achieve competitiveness and a soft image (Bibi et al., 2020). These trends have forced hospitality organizations to attract and retain highly skilled employees to meet customer demand and compete. Leadership is paying more attention to workplace well-being. It is the most operational approach to enhance innovations, organization performance, and creativity (Bibi et al., 2020). CSR activities are among the many elements that influence employee behaviour (Farid et al., 2020).

CSR can be categorized into four major dimensions, explicitly economic, legal, ethical, and philanthropic (Su & Swanson, 2019). Economic CSR is concerned with producing goods and services to meet the demand of various stakeholders. CSR's legal features are related to an organization's obligation to abide by a country's law (Hyeli Lina Kim et al., 2018). The ethical aspects are focused on an organization to be rational and fair in decision making; besides, the philanthropic dimension is motivated to promote goodwill and human well-being (H. Kim et al., 2020).

2.2. CSR- need satisfaction and hedonic happiness

Researchers categorized the broad concept of CSR according to their studies' objectives; for instance, B. Hu et al. (2019) divided CSR into extra-role and in-role CSR participation. Chang (2015) studied CSR in terms of proactive and reactive CSR. Story and Neves (2015) considered CSR's intrinsic and extrinsic motives in relation to in-role and extra-role employee performance. This study focuses on CSR at the employees' level of analysis by following the dichotomous construct of H. Kim et al. (2020) in terms of instrumental and volunteer CSR. Instrumental CSR refers to those socially responsible operations and activities that directly influence employees. In contrast, volunteer CSR are activities that have an indirect impact on employees' well-being. The economic aspect of instrumental CSR from the hotel viewpoint comprises rational employment policies and support services for employees' families (Hyelin Lina Kim et al., 2017). Instrumental CSR's legal perspective contains practices such

as a reasonable workload as per law, hiring and firing, employment benefits, compensations, and equal employment opportunities (H. Kim et al., 2020; Y.-K. Lee et al., 2012).

CSR is also an encouraging influencer of employee job satisfaction and quality of life in the hospitality industry (Hyeli Lina Kim et al., 2018). Trends reveals that a handful of researchers examine subjective well-being and life satisfaction in the hotel industry from the employees' perspective (Su & Swanson, 2019). The study of happiness and well-being emanates from motivation theories explaining why people behave and the causes. There are two basic approaches to happiness — hedonic and eudemonic. Hedonic focuses on pleasure, comfort, enjoyment, and eudemonic concentrate happiness as valuable life in terms of meaning, growth, and authenticity (Czerw, 2019).

Hedonic happiness refers to the quality of life derived from experiencing pleasure and enjoyment and low pain (Sirgy, 2012). An example of hedonic happiness at work is getting paid properly, enjoying one's job, a better work environment, job security, and health benefits (Sirgy, 2012). Instrumental CSR can directly impact hotel employees by satisfying their material and social needs. Hedonic happiness brings a more stable and cognitive appraisal of life because it is based on basic psychological needs (Lin & Chan, 2020). Research shows that hedonic motives are positively linked to satisfaction with basic needs (Huta & Ryan, 2010). Trends also indicate that immediate pleasure is positively associated with needs satisfaction (Ruini & Vescovelli, 2013).

Firm CSR initiatives and activities can, directly and indirectly, satisfy employees' needs that impact their happiness level. Instrumental CSR creates a positive work environment and reduces uncertainties. Hilton hotel chain provides paid parental leaves equally to top management and line staff (Ludden, 2016). Besides, to keep its employees and associate happy, Hilton offers comprehensive Hilton employee benefits programmes comprising different savings, pension plans, and welfare incentives (Tractorsinfo, 2020). Similarly, through the 'Go Hilton team member travel program' and 'Go Hilton friends and family program', the company cares and supports employees and their family well-being (Tractorsinfo, 2020). Hilton also provides adoption assistance benefits for its employees to have a happy family life (Contributor, 2020). Managers, supervisors, and leaders believe that making employees happier and healthier encourages them to enhance productivity and individual performance (Fisher, 2003).

Need satisfaction theory holds that employees have economic, family, health, and safety needs at the workplace (J.-S. Lee et al., 2015). The balance between family life and work and economic benefits significantly influences employees' satisfaction in the lodging industry (Deery, 2008). Based on the need satisfaction theory (Deci & Vansteenkiste, 2004), we assumed that instrumental CSR composed of economic and legal CSR activities and operations at the workplace might influence employees' hedonic happiness through basic need satisfaction. The employee's affective or emotional aspects explain the balance between the perceived and actual hedonic happiness of pleasant and unpleasant effects. Employees' cognitive features are subjective evaluations of life satisfaction (B. Hu et al., 2019). Thus, an employee who perceives good working conditions, receives appropriate compensation, and health benefits would enjoy his job and feel more pleasure. The conceptual design of the study is given in Figure 1. Hence, based on the mentioned logic, we assume that instrumental CSR directly influences employee needs and leads to hedonic happiness.

H1: Instrumental CSR is a positive predictor of hotel employees' basic need satisfaction

H2: Need satisfaction is a positive predictor of hotel employees' hedonic happiness

2.3. CSR- self-esteem and eudemonic happiness

The ethical dimension of volunteer CSR from hotel employees' perspective comprises promoting moral values, meeting social, legal, and ethical standards (Y.-K. Lee et al., 2012). The philanthropic CSR aspects consist of participating in charity, protecting the environment, and promoting hospitality stakeholders' well-being (Su & Swanson, 2019). Eudemonic happiness focuses on self-

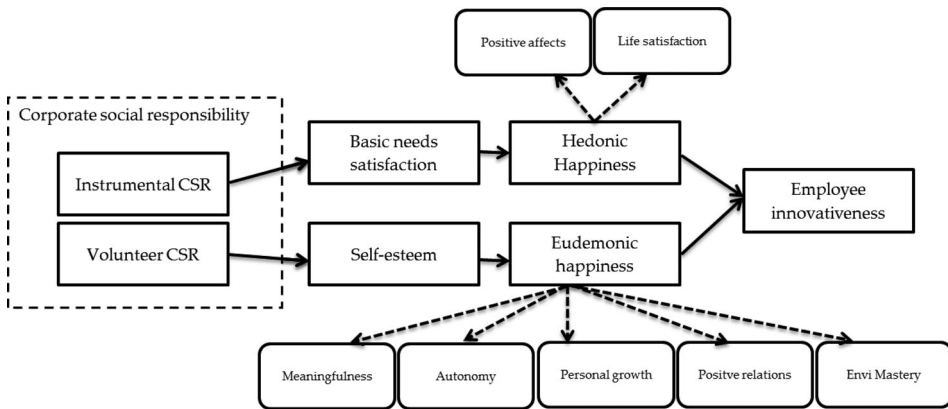

Figure 1. Conceptual design of corporate social responsibility, happiness and employee innovativeness.

realization, the meaning of life, and a fully functioning life (Ryan & Deci, 2001). As compared to the hedonic approach, eudemonic happiness is less explored in the workplace environment. Eudemonic happiness is the quality of life derived from utilizing an individual best potentials to achieve self-realization, autonomy, personal growth, self-acceptance, and meaning in life (Waterman et al., 2010). Eudemonic happiness explains an individual mental state of self-realization (Son & Wilson, 2012).

Self-esteem is a personal resource that contributes to self-realization and good functioning life (der Kinderen & Khapova, 2020). Self-esteem is the degree to which individuals believe how much he/ she is valuable for the organization, respect themselves, and respect co-workers (Pierce & Gardner, 2004). Workplace conditions and organizational experience highly influence employee self-esteem. Needs drive human behaviour, one of which is the need for a sense of personal importance or self-esteem (Khan, Bibi, Lyu, Garavelli, et al., 2020). Employees have a deep-rooted need for approval and validation from other organization members and society at large.

The volunteer CRS activities portray a positive image of the organization to society and employees (H. Kim et al., 2020). This soft image generates a sense of self-esteem in employees who perceive or act in such activities. The employees feel proud of their socially responsible activities and acknowledge their organization as an optimistic contributor to society at large (Ferris et al., 2009). Employee level self-esteem is composed of self-trust, self-confidence, self-acceptance, and self-complacency. Business conditions that allow and motivate employees for self-esteem are encouraged to perform more efficiently as per Herzberg's Motivation-Hygiene theory (Sachau, 2007).

Therefore, employees with a high level of self-esteem consider themselves more valuable, meaningful, capable, and worthy within their hiring organization. Eudemonic happiness occurs when individual activities are consistent or engaging with profound societal values and authentic moral standards (Ryan & Deci, 2001). Hence, from this perspective, happiness is the actualization of individual full potentials and recognizing the true domain and nature of one's life. Eudemonic happiness has a strong relationship with self-acceptance — a positive attitude towards one's self (Czerw, 2019). Based on self-determination theory (Gagné & Deci, 2005), individuals are motivated for personal growth and self-recognition. Acknowledging employees' effort and appreciation creates a sense of happiness. Self-esteem develops a sense of community and, at the same time, empowers individuals to focus on their role within the organization.

Pro-social behaviour theory reveals that individuals are motivated to help, share, and intentionally volunteer for seemingly no reward to feel worthy and noble (Valor, 2006). Hospitality organizations arrange volunteering programmes for their employees to make them feel that they are contributing and valuable to the community. For instance, Hilton hotels provide four-week sabbatical leaves with

\$5000 to employees to learn skills, volunteer for a cause, or pursue a passion and feel happier (Contributor, 2020). CSR activities provide a platform for the employees to volunteer for a happier, healthier, and more socially connected life. Volunteering helps to learn new skills, utilize experience, connect with the community, and bring fulfilment to employees' lives. Further, volunteering provides a sense of purpose, increase self-confidence, combat anxiety, and make the employee happy by feeling valuable (Do Paco & Nave, 2013).

We believe that CSR's ethical and volunteering components are associated with eudemonic happiness at the workplace through other organizational mechanisms. Volunteering makes a person feel good though it has a component of pain. Meeting ethical values and standards and volunteering merely not only make one's mood good but also satisfaction with life, a sense of autonomy, environmental mastery, purpose, and meaning to life (Son & Wilson, 2012). An employee who would perceive his/ her organization is meeting ethical standards and actively participating in the community welfare and charity programmes would feel more self-esteem. Based on the debated logic and literature trends, we assume that volunteer CSR produces high self-esteem, which is a predictor of eudemonic happiness at the workplace.

H3: Volunteer CSR is a positive predictor of hotel employees' self-esteem

H4: Self-esteem is a positive predictor of hotel employees' eudemonic happiness.

2.4. Hedonic and eudemonic happiness – employee innovativeness

Employee innovativeness is a complex process of tendencies and behaviours comprised of idea generation, promotion, realization, and implementation to enhance performance (Bibi et al., 2020; Khan, Bibi, Lyu, Garavelli, et al., 2020). Innovativeness can be seen as the successful implementation of creativity. Innovativeness requires a certain level of intellection, skills, knowledge, motivation, and capabilities (Huhtala & Parzefall, 2007). Employee individual innovativeness is barely studied in the context of hedonic and eudemonic happiness. A handful of studies develop relationships between subjective well-being, employee well-being, innovations, and innovativeness (Huhtala & Parzefall, 2007). These studies also have their limitations, either conducted in a non-work environment or lacking empirical evidence.

In the workplace context, employees' needs are comprised of economy, health and safety, family, knowledge, social, esteem, aesthetics, and self-actualization needs (Sirgy et al., 2001). A safe working environment provides a sense of safety and wellness to the employees. Compensation, family benefits, and job security are concerned with economic needs. Family and social needs deal with the social equilibrium in life. Esteem needs are associated with being valued and accepted by co-workers and society on behalf of the organization. Self-actualization enhances employee potentials through work, where aesthetic and knowledge needs are concerned with idea generation and employee creativity (H. Kim et al., 2020).

Sirgy et al. (2001) divided workplace quality into two broad dimensions based on Maslow's need theory; satisfaction with basic needs and growth needs. The basic needs satisfaction is concerned with employee satisfaction with economy, health, and family needs by using organizational resources. The workplace's growth dimension includes employee satisfaction with social, self-actualization, knowledge needs, and aesthetics desires by utilizing corporate resources. Dolan and Metcalfe (2012) proposed that subjective well-being and creativity are correlated; however, they call for further research to determine the direction of causality. We assume that when an employee's basic needs are met, he/ she is more motivated to perform in creative and innovative manners. The eudemonic segment motivates an employee to fully engage in meaningful work and understand his/ her job to the best. By performing meaningful work, any employee feels purpose, self-respect, and self-realization (Raub & Blunschi, 2014). Besides, self-realization encourages employees to utilize their full potential to innovate, which provides pride and status. Acquiring and sharing

knowledge makes an employee more learned and perform the job more creatively. Thus, in the presence of the above literature and logical discussion, we assumed the following hypotheses.

H5: Hedonic happiness is a positive predictor of employee innovativeness

H6: Eudemonic happiness is a positive predictor of employee innovativeness

3. Methodology

We used a cross-sectional survey design for data collection. A questionnaire was developed of the mentioned constructs in the English language and translated to the Chinese language. A set of the required twelve factors was obtained using exploratory factor analysis (EFA) in SPSS with 64 items. We removed three items each from volunteer and instrumental CSR, one item from basic need satisfaction, two items from life satisfaction scale, two items from self-esteem, four-item from the positive affects scale, two items from autonomy, one item from personal growth, two items from environmental mastery, and four items from employee innovativeness either due to low loadings or high cross-loading. A confirmatory factor analysis (CFA) was run in AMOS with two second-order variables: hedonic and eudemonic, and five first-order variables consisting of volunteer CSR, instrumental CSR, and basic need life satisfaction, self-esteem, and employee innovativeness.

3.1. Industrial setting

We have selected twelve full-scale services hotels in Shanghai, China (4 and 5 stars) as our sample. Several hotel managers were contacted for a short interview to know about their hotel's CSR initiatives. Our sample of twelve hotels is based on the initial information collected about hotel CSR activities. We assured the hotel managers about data privacy, and the data would be used only for research.

3.2. Sample size

We applied a random sample technique for data collection. It is observed that previous studies mostly focused on hotel frontline employees (Park & Levy, 2014) and ignored the rest of the employees working in other departments of hotels. We have collected data from the hotel frontline, house-keeping, food and beverage, marketing and finance, laundry, engineering and maintenance, hotel restaurants, and security departments. A total of 650 questionnaires were distributed among the respondents with small souvenirs from 10 to 20 August 2020. We received a total of 337 questionnaires, out of which 311 were found good. The sample's demographic features are given in Table 1, which shows that 56.27% of the respondents were male, and 43.73% were females. The maximum number of the respondents (26.36%) belonged to the 26–30 years group. The respondents' spread reveals that 45.98% belonged to the income group of less than 4000, 23.33%, and 17.79% to 9000–10,000 Chinese ¥. The structural equation model does not assume normality (Gao et al., 2008). Our normality test approves that our univariate measures are normally distributed and meet the threshold criteria suggested by West et al. (1995). Our structural model shows multivariate non-normality; however, SEM packages and procedures widely ignore multivariate normality.

3.3. Measurements

A dichotomous measurement of perceived organization CRS in terms of perceived instrumental and volunteer CSR activities was adapted from H. Kim et al. (2020) with changes in the statements as per our study's requirement. The instrumental CSR activities include items such as 'the hotel closely monitors employee performance'. Volunteer CSR activities contain items such as 'the hotel tries to

Table 1. Demographic features.

Demographics	Characteristics	N	%
Gender	Male	175	56.27
	Female	136	43.73
Age	18–25 years	82	26.36
	26–30	122	39.23
	31–35	77	24.76
	36–50	30	9.64
	Less than 4000 ₺	143	45.98
Monthly Income	5000–8000 ₺	85	27.33
	9000–10,000 ₺	46	17.79
	10,000–15,000 ₺	25	8.04
	Above 15,000 ₺	12	3.86
	Waiters	73	23.47

	High school	137	44.05
	Under graduate	93	29.90
Level of education	Graduate	45	14.47

contribute to community well-being'. The perceived instrumental CSR scale is comprised of 6-items, and perceived volunteer CSR included 7-items. The responses were measured using a five-point Likert-scale ranging from 'strongly disagree' to 'strongly agree'.

We adapted Pierce et al. (1989) scale for measuring employee self-esteem with four items. H. Kim et al. (2020) 's basic need satisfaction measurement was expanded to five items scale. The hedonic happiness was measured by two sub-construct satisfaction with work-life and positive affects. We borrowed ED Diener et al. (1985) five-point life satisfaction scale and made changes as per our study's requirement to measure satisfaction at work life. We borrowed 6 items scale from Son and Wilson (2012) to measure positive affects and make changes per our study's requirement.

We measured eudemonic happiness with five sub-constructs: meaningfulness, autonomy, personal growth, purpose in life, and environmental mastery. A seven-item scale was borrowed from May et al. (2004) to measure the meaningfulness and altered as per our study's context. Autonomy was measured with a four-point scale adapted from B. Hu et al. (2019). A five items scale was borrowed from Abbott et al. (2010) to measure personal growth. The positive relationship with others was measured with a seven-item scale, and environmental mastery with five items scale borrowed from Sirgy (2012). Employee innovativeness was measured with seven items scaled adapted from George and Zhou (2001). The items of all the scales mentioned are provided in the Supplementary Appendix.

4 Results

4.1. Common method variance (CMV)

This study's data collection was made under the cross-sectional survey design from a single source, often leading to common method bias, a kind of spurious variance linked with the measurement techniques (Bibi et al., 2020). Literature reveals various mechanisms to deal with this issue; however, Harman's single factor test is often applied in social sciences, which assumes that the variance explained by the first factor should be less than fifty percent of the total explained variance (Khan, Bibi, Lyu, Garavelli, et al., 2020). Harman's test result shows that the first factor explained a total variance of 28.56% below the mentioned cutoff value; hence, our data is free from CMV.

4.2. Reliability and validity

We have borrowed and adapted scales from various previous studies; hence, we performed an exploratory factor analysis with a total of sixty-four items with fixed twelve factors. The items loading less than 0.4 were removed at the first stage of EFA, then at the second stage removed all those items having high cross-loadings as this creates a problem of discriminant validity. Finally, we obtained a twelve-factors solution with 43 items with (KMO = 0.887, Bartlett's test = 9363.78, $p = 0.0000$). A CFA with 43 items with two second-order (hedonic and eudemonic happiness) and five first-order factors included instrumental and volunteer CSR, basic need satisfaction, self-esteem, and employee innovativeness were performed with the maximum likelihood method to establish the threshold convergent and discriminant validity, and composite reliability (CR). The reliability (Cronbach Alpha) and composite reliability values in Table 2 for each construct are higher than the required cutoff value of 0.7, indicating the constructs' internal consistency (Khan, Bibi, Lyu, Garavelli, et al., 2020).

The values of $CR > 0.7$ and the total average variance explained (AVE) > 0.5 , where $CR > AVE$, hence, meet the requirements of convergent validity (Bibi et al., 2020) for each construct, as shown in Table 2. The discriminant validity, which indicates the deviation of constructs from each other, was assessed through $AVE > MSV$ criteria. The results in Table 2 indicate that $AVE > MSV$ for first-order constructs revealing the discriminant validity for these constructs. The $AVE < MSV$ for second-order constructs violating discriminant validity assumption. Hayes (2017) suggested that the discriminant validity for second-order constructs is not required. Diagonal square root values of AVE of hedonic and eudemonic happiness are less than the other construct's correlation as shown in Table 3. Hence, it violates the discriminant validity assumption that the AVE value's square root should be greater than the correlation between the constructs (Bibi et al., 2020). The results in Tables 2 and 3 for the measurement model extend to support our proposed model's use.

4.3. Measurement model

The measurement model fit was analyzed with Hair et al. (2011) proposed criteria of absolute, incremental, and parsimonious fit in line with L. t. Hu and Bentler (1999). The results in Table 4 indicate a good absolute fit of measurement model as $\chi^2/Df = 1.534$ less than the cutoff value of 3–5, SRMR = 0.054 less than the cutoff value of 0.09, RMSEA = 0.042 less than the threshold of 0.05, PCLOSE = 0.999 > 0.05 . NFI and PNFI's value is permissible and indicates a good incremental fit (Hair et al., 2017). The CFI and IFI > 0.95 and TLI ≥ 0.94 reveal a good parsimonious fit of the measurement model.

4.4. Structural model

The structural model was performed with a maximum likelihood method as per the proposed design in Figure 1. The structural model indicates a good absolute fit, where $\chi^2/Df = 1.534 < 3-5$, SRMS = 0.08 < 0.09 , RMSEA = 0.048 < 0.05 , and PCLOSE = 0.722 > 0.05 as shown in Table 4. The structural model also meet the requirement of good instrumental fit as NFI = 0.853 and PNFI = 0.790. The value of CFI = 0.943, IFI = 0.942, and TLI = 0.936, whereas the CFI and IFI are near to great fit, and TLI represent a good fit (L. t. Hu & Bentler, 1999).

4.5. Hypotheses testing

The standardized coefficients are used to analyze the assumed hypotheses. The t-values are equal to critical ratio (C.R.) values, as shown in Table 5. The results show that instrumental CSR is positively linked to employees' basic needs satisfaction with $\beta = 0.49$, $t = 4.41$, and $p = 0.001$, supporting our proposed assumption in H1. Employees' basic need satisfaction was positively associated with employees' hedonic happiness with $\beta = 0.353$, $t = 3.182$, and $p = 0.007$, which supports the second

assumption in H2. Furthermore, volunteer CSR reveals a positive relationship with employee self-esteem with $\beta = 0.362$, $t = 3.559$, $p = 0.001$, hence, hold the proposed hypothesis in H3. H4 assumes that an employee's self-esteem influences his/ her eudemonic happiness. The results indicate that self-esteem significantly influences employee eudemonic happiness ($\beta = 0.424$, $t = 4.071$, $p = 0.001$). We accept the supposition in H5 that employee hedonic happiness significantly influences employee's innovativeness ($\beta = 0.541$, $t = 4.676$, $p = 0.001$). The results are also in line with H6 that eudemonic happiness significantly influences employees' innovativeness. The path diagram of the proposed hypotheses is given in [Figure 2](#).

5. Discussion

Employees are considered the most precious stakeholder in tourism and hospitality organizations (J.-S. Lee et al., 2015). This study examined the influence of hotel employees' perceived CSR on their

hedonic and eudemonic happiness through the mechanism of employee's basic need satisfaction and self-esteem in light of need satisfaction and self-determination theory. In turn, employee's hedonic and eudemonic happiness at work influences their innovativeness. The results indicate that instrumental CSR that deals with economic and legal CSR aspects potentially predicted hotel employees' basic needs satisfaction. In contrast, perceived volunteer CSR consisting of CSR's ethical and philanthropic dimensions significantly predicted employees' self-esteem.

Moreover, the results show that employees' basic needs satisfaction significantly predicted hotel employees' hedonic happiness. Hedonic happiness is a state of mind focusing on feelings of pleasure, calmness, and joy, and the absence of pain (Sirgy, 2012). Hedonic happiness is determined by the summation of positive feelings in life, and life satisfaction deals with the cognitive evaluation of overall life satisfaction. In light of utilitarian philosophers such as Jeremy Bentham (Sirgy, 2012), it can be argued that employees' perceived organizational benefits maximize their hedonic happiness by satisfying their basic needs.

Thus, we argued that employees evaluate perceived instrumental CSR based on their utility in deriving pleasure and decreasing pain. The employees' hedonic happiness based on the humanistic perspective can be interpreted as satisfaction with individual needs. The Maslow hierarchy of needs supports our findings that satisfaction with basic need predicts hedonic happiness. The idea here is that when an employee experiences satisfaction with basic needs (such as biological, safety and security, and economic needs), so he/ she experiences hedonic happiness. Thus, those hotels that honoured the contractual obligations with employees, maximize profit, monitor employee performance, comply with the law, and establish long-term economic growth can better meet their employees' basic needs satisfaction and enhance their hedonic happiness.

On the other hand, results reveal that self-esteem significantly predicted eudemonic happiness. Eudemonic happiness is associated with virtue, where virtue is regarded as a process of wisdom, relatedness, and courage (Seligman, 2002). It is argued that hotel employees who are high in self-esteem experience a high level of eudemonic happiness. Employees with high self-esteem are motivated to help others and contribute to society; besides, they are highly expressive (autonomy), confident, and keen to have a purposeful life.

It is further argued that a hotel employee who experiences high self-esteem would strive to accept a challenge to utilize his/ her full potentials to achieve high accomplishment. This study's findings support the self-determination theory, which assumes that humans possess an inborn desire to utilize their full potentials (B. Hu et al., 2019). Thus, perceived volunteer CSR provides opportunities to hotel employees for self-identity, competence, and belongingness that lead to self-esteem. Simultaneously, self-esteem is necessary for achieving competence, personal growth, meaning in life, and positive relationship with others. Self-esteem is highly connected to help others and contribute to the community at large, which is the main pillar of eudemonic happiness (der Kinderen & Khapova, 2020). Besides, self-esteem as a personal resource contributes to good functioning; however, self-esteem evolves and is shaped by the organization's environment and activities that impact employee psychological life dimensions. In sum, it is concluded that employees who perceive their hotel as more involved in volunteer CSR are high in self-esteem and influence their eudemonic happiness.

Furthermore, the results show that hedonic and eudemonic happiness significantly influences employee innovativeness. Employee-level innovativeness comprises idea generations, promotion, and realization to enhance productivity and achieve competitive advantages (Khan, Bibi, Lyu, Garavelli, et al., 2020). It is argued that individuals who feel positive affects – enjoying a job, good working conditions, seeking pleasure, feeling full of life at work – and achieving near-identical what he/she wants at work, experience high hedonic happiness. Employees' job satisfaction leads to work engagement, organization identification, work commitment, and loyalty (Grosser et al., 2018). All these mentioned aspects motivate and inspire an employee to perform more than expected from him/her, leading to out-of-box thinking, knowledge sharing, teamwork, learning, cooperation and collaboration, and enhanced performance (Bibi et al., 2020).

The eudemonic happiness constituents are the essential ingredients of employee innovativeness. Employee engagement in innovations requires the ability and willingness to innovate. Abilities include cognitive competencies, task-related knowledge, skills, expertise, and personal traits. Willingness comprises the required motivation and satisfaction with work objectives (meaningfulness). The above-average level of knowledge, intelligence, and task-specific expertise facilitate innovativeness. Environmental mastery – the ability to perform one's job to perfection with creativity – provides a high job satisfaction level. Thus, it is argued that eudemonic happiness motivates and inspires individuals for personal growth, contributes to teamwork, organization, and society, leading employees to perform beyond what is expected.

5.1. Theoretical implications

This study is motivated to extend the micro-level CSR application in the hospitality concerned with employee-level outcomes. Further, demonstrate the prominence of an employee's level CSR by connecting it to self-determination theory, pro-social theory, and need satisfaction theory. Our findings under the framework of needs satisfaction theory established that hotel employees care for instrumental CSR because it is directly linked to their basic needs and indirectly influence their hedonic happiness. This study's findings expand CSR knowledge beyond the known paradigms (job satisfaction, engagement, commitment) by providing empirical evidence that hotels can improve employees' innovativeness by fulfilling their basic needs and enhancing hedonic happiness.

Hedonic happiness is seen as a consistent and reliable indicator of employees' general happiness and satisfaction at work-life (Ryan & Deci, 2001) and can be linked to employee performance and retention. However, hedonic happiness does not explain the cognitions and functioning involved to achieve happiness at work. Hence, the concept of happiness in terms of an employee's desire for using full potentials or fully functioning work-life lends itself to eudemonic happiness. The employees may work in risky conditions and show a willingness to take the pain for growth and high accomplishment for self-acceptance, career growth, contribution to the organization and society.

Under the framework of self-determination theory, we argued that hotel employees care for volunteer CSR because it provides them with opportunities to fulfil their desire for self-realization, autonomy, and meaningfulness in life. Self-determination theory supports empirical findings from the perspective that eudemonia is the process of living a fully functional life to satisfy autonomy, relatedness, personal growth, and competence needs (der Kinderen & Khapova, 2020). In light of Herzberg two factor theory, it is argued that hotel employees perceived CSR motivates employees to boost their self-esteem, enhancing self-recognition and meaningfulness of work. It leads to eudemonic happiness, which increases employees' willingness to work engagement and result in individual innovativeness. Besides, performing volunteer CSR activities is stressful; the 'broaden and build-theory of positive emotions' claims that humans require positive emotions enlightenment – enhance coping behaviours – for developing resilience against stress.

In the end, the most prominent contribution of this study is the identification of psychological directions and routes through which hotels can enhance employees' happiness at work in terms of hedonic and eudemonic paradigms. The coefficients of hedonic and eudemonic happiness demonstrate a significant influence on employee innovativeness. Literature trends reveal that the hospitality industry research focused on CSR is more concerned with performance, production, and soft image building. However, ignore that a happy employee is a key to performance, competitiveness, customer satisfaction, and innovations. Therefore, our findings advance the employee level outcomes of perceived CSR and enhance the understanding of psychological routes that connect CSR to happiness and employees' innovativeness in the hotel industry. Besides, enlarge the theoretical periphery of need satisfaction theory, self-determination theory, and provide support to maximum pro-social theories.

5.2. Managerial and practical implications

The findings provide a deep insight into employee level CSR in the context of hotel workers. Hotels employees are considered under great stress, chronic depression, and other issues due to long working hours, low wages, and tough schedules. This study demonstrates that hotels can enhance employees' happiness (hedonic and eudemonic) by using CSR as a strategic tool. It propagates the significance of CSR strategies for improving employee performance and internal promotion. Employees are the brand emissaries of hotels, and their happiness is a critical dimension for performing their jobs to the best. Trends reveal that workplace conditions and interactions can transform employees' thinking, work engagement, meaningfulness, and higher-level satisfaction (Kang & Busser, 2018; Nazir & Islam, 2020). Thus, hotels can achieve competitive advantages by enhancing employees' happiness through CSR approaches. Employees with a good mood and positive state of emotions are committed, loyal, and maintain a well-organized working schedule (B. Hu et al., 2019). From the managerial perspective, this study's results indicate that the perceived CSR policies are highly associated with employees' happiness. Through the lens of a micro-level CSR perspective, managers can link instrumental and volunteer CSR strategies to employees' innovativeness by linking it to employees' basic needs and self-esteem. The employees care for instrumental CSR due to its financial implications for the satisfaction of their basic needs and volunteer CSR because of its direct relationship to society.

The dichotomous division of CSR strategies and their linkages to employees' happiness and innovativeness provides managers with operational guidelines for developing CSR initiatives aiming at human resource management. Managers can develop such CSR policies that foster an effective work environment and enhance employees' happiness. It would encourage and motivate them to perform innovatively for their personal growth and organizational goals. Employees' hedonic happiness is critical for hotel success as employees with positive mood perform beyond the expectations, which reduces production and human resource costs. This study exhibited that CSR activities at hotels can enhance employee's happiness. Still, it occurs only when CSR perceptions meet their basic needs and offer them opportunities to achieve the desired autonomy, mastery, relatedness, and competencies. Managers can use CSR from a human capital perspective to offer intangible rewards to employees through personal growth and meaningfulness at work. Therefore, it is recommended that hotels should consider CSR to enhance employees' happiness in terms of basic needs satisfaction, personal growth, mastery, relatedness, community well-being, and respect for cultural values. Hotels should conduct CSR awareness and training programmes for employees to recognize that organizations care for their needs and society's well-being.

Hotels, tourism destinations, and event managers can enhance employees' high (growth needs) and low (basic requirements) needs by implementing attractive CSR strategies. For instance, managers can consider implementing volunteer CSR activities to satisfy employees' higher-end needs of self-esteem, self-actualization, and learning. Managers are also recommended to consider the job positions of their employees in designing CSR policies. Literature reveals that lower-level employees are more concerned about their basic needs and upper level are more conscious about status, welfare, fame, and delivery to society at large (H. Kim et al., 2020). Employees CSR needs at the various level is critical for tourism and hospitality organizations due to its labor-intensive nature; thus, personalized CSR activities according to employees positions can increase happiness and ensure organizational success.

6. Conclusion, future research prospectus, and limitations

This study examined how hotel employees' CSR initiative perception influences their happiness in two broad paradigms. Hotels employees are the ambassadors of organizational norms and values, and their happiness at work is critical for organizational success. This study's findings broaden the context of CSR by linking it beyond the traditional applications and offering new directions for

future research. Our study empirically established that CSR's dichotomous division from a human resource perspective is useful. It helps to understand that basic and second stage needs can fulfil employees' satisfaction in terms of biological and psychological needs. Besides, an employee needs positive emotions, a good mood, cognitive abilities, autonomy, self-worth, job meaningfulness, and organizational support to think out of the box to innovate and grow. In conclusion, managers can enhance employees' hedonic and eudemonic happiness through CSR initiatives and could help hotels to improve the individual level of innovativeness, which in turn would advance organizational progress and result in product, process, and business model innovations.

This study has several limitations that offer potential openings for future research. First, our study ignored any moderator's use; future researchers can use job position as a potential moderator to predict what positions are more inclined toward instrumental and volunteer CSR, besides, who cares more about hedonic happiness and eudemonic happiness. Income and age are also possible moderators for examining the employees' perceptions of CSR and happiness. Second, the researchers can use job satisfaction, job resources, and work activities between instrumental CSR and hedonic happiness. Third, researchers are recommended to examine the role of self-acceptance, self-realization, and community well-being between volunteer CSR and eudemonic happiness. Fourth, we applied the cross-sectional research design; it is recommended to apply the longitudinal framework to compare employee happiness. Fifth, we focus on the hotel industry; researchers are urged to apply the same research design in a cross-industry framework to check its validity in different work backgrounds. Further, researchers are recommended to investigate the instrumental and volunteer CSR to hedonic and eudemonic happiness under the context of utility and economic theories, pro-social theories, and happiness theories.
